OPERATIONS AND ALGEBRAIC THINKING (OA)

Cluster: B. Understand and apply properties of operations and the relationship between addition and subtraction.

Standard: 1.OA.B.3 Apply properties of operations (additive identity, commutative, and associative) as strategies to add and subtract. (Students need not use formal terms for these properties.)

0	Teacher presents student with two examples for each property of operations (additive identity, commutative, and associative) as strategies to add within 20.	Student accurately completes no examples for any property of operation (0 total correct).
1	Teacher presents student with two examples for each property of operations (additive identity, commutative, and associative) as strategies to add within 20.	Student accurately completes two examples for one property of operation (2 total correct).
2	Teacher presents student with two examples for each property of operations (additive identity, commutative, and associative) as strategies to add within 20.	Student accurately completes two examples for two properties of operation (4 total correct).
3	Teacher presents student with two examples for each property of operations (additive identity, commutative, and associative) as strategies to add within 20.	Student accurately completes two examples for all three properties of operation (6 total correct).
4	<p>In addition to providing evidence that the student met expectations of level 3:</p> <ul style="list-style-type: none"> Student must also explain or defend the accuracy of each of their answers. <p>AND</p> <ul style="list-style-type: none"> Verbally or through writing, the student demonstrates an understanding that these properties do not apply to the operation of subtraction and provides examples and an explanation as to why. 	
5	<p>In addition to providing evidence that the student met expectations of level 3 and 4: Student explains in either verbal or written form (without using the formal terms for the properties) when one property (additive identity, commutative, or associative) is useful as a strategy for addition and provide an example to justify their thinking.</p>	
6*	<p>In addition to providing evidence that the student meets expectations of levels 3, 4, and 5: Student explains in either verbal or written form (without using the formal terms for the properties) when two properties (additive identity, commutative, or associative) is useful as a strategy for addition and provide an example to justify their thinking.</p>	
7*	<p>In addition to providing evidence that the student meets expectations of levels 3, 4, 5, and 6: Student explains in either verbal or written form (without using the formal terms for the property) when all three properties (additive identity, commutative, and associative) is useful as a strategy for addition and provide an example to justify their thinking.</p>	

Note: Mathematical tools and/or representations may be used.

First Grade Mathematics

OPERATIONS AND ALGEBRAIC THINKING (OA)

Cluster: C. Add and subtract within 20.

Standard: 1.OA.C.5 Add and subtract within 20 using strategies such as counting on, counting back, making 10, using fact families and related known facts, and composing/ decomposing numbers with an emphasis on making ten (e.g., $13 - 4 = 13 - 3 - 1 = 10 - 1 = 9$ or adding $6 + 7$ by creating the known equivalent $6 + 4 + 3 = 10 + 3 = 13$).

0	<ul style="list-style-type: none"> • Teacher presents student with two addition problems each (within 20) for <u>three of the four</u> strategies below (6 total problems): <ol style="list-style-type: none"> 1) counting on, 2) making 10, 3) using fact families (related known facts), or 4) composing/decomposing numbers with an emphasis on making 10. <ul style="list-style-type: none"> ○ <u>Student does not accurately complete any problems (0 total correct).</u> ○ Students may use concrete objects or drawings. NUMBERS AND OPERATIONS IN BASE TEN (NBT)

Cluster: B. Understand place value.

Standard: 1.NBT.B.2 Know that the digits of a two-digit number represent groups of tens and ones (e.g., 39 can be represented as 39 ones, 2 tens and 19 ones, or 3 tens and 9).

0	<ul style="list-style-type: none"> • Teacher presents student with a 2-digit number and prompts the student to represent the number as groups of tens and ones in as many ways as they can. <ul style="list-style-type: none"> ◦ Student does not accurately represents the number as groups of tens and ones. <p>AND</p> <ul style="list-style-type: none"> • Teacher presents student with a different 2-digit number and the same prompt. <ul style="list-style-type: none"> ◦ Student does not accurately represent the new number as groups of tens and ones. <p>*Cubes or base ten blocks may be used.</p>
1	<ul style="list-style-type: none"> • Teacher presents student with a 2-digit number and prompts the student to represent the number as groups of tens and ones in as many ways as they can. <ul style="list-style-type: none"> ◦ Student accurately represents the number as groups of tens and ones in one way. <p>AND</p> <ul style="list-style-type: none"> • Teacher presents student with a different 2-digit number and the same prompt. <ul style="list-style-type: none"> ◦ Student accurately represents the new number as groups of tens and ones in one way. <p>*Cubes or base ten blocks may be used.</p>
2	<ul style="list-style-type: none"> • Teacher presents student with a 2-digit number and prompts the student to represent the number as groups of tens and ones in as many ways as they can. <ul style="list-style-type: none"> ◦ Student accurately represents the number as groups of tens and ones in two different ways. <p>AND</p> <ul style="list-style-type: none"> • Teacher presents student with a different 2-digit number and the same prompt. <ul style="list-style-type: none"> ◦ Student accurately represents the new number as groups of tens and ones in two different ways. <p>*Cubes or base ten blocks may be used.</p>
3	<ul style="list-style-type: none"> • Teacher presents student with a 2-digit number and prompts the student to represent the number as groups of tens and ones in as many ways as they can. <ul style="list-style-type: none"> ◦ Student accurately represents the number as groups of tens and ones in three different ways (e.g., 39 can be represented as 39 ones, 1 ten and 29 ones, 2 tens and 19 ones, or 3 tens and 9 ones). <p>AND</p> <ul style="list-style-type: none"> • Teacher presents student with a different 2-digit number and the same prompt. <ul style="list-style-type: none"> ◦ Student accurately represents the new number as groups of tens and ones in three different ways. <p>*Cubes or base ten blocks may be used.</p>
4	<ul style="list-style-type: none"> • Teacher presents student with a 2-digit number larger than 50 and prompts the student to represent the number as groups of tens and ones in as many ways as they can. <ul style="list-style-type: none"> ◦ Student accurately represents the number as groups of tens and ones in all possible ways. <p>*Cubes or base ten blocks may be used.</p>
5	<ul style="list-style-type: none"> • Teacher presents student with a 2-digit number larger than 50 and prompts the student to represent the number as groups of tens and ones in as many ways as they can. <ul style="list-style-type: none"> ◦ Student accurately represents the number as groups of tens and ones in all possible ways. ◦ Student also justifies that all representations have been used. <p>*Cubes or base ten blocks may be used.</p>
6*	<ul style="list-style-type: none"> • Teacher presents student with a 2-digit number larger than 50 and prompts the student to represent the number as groups of tens and ones in as many ways as they can. <ul style="list-style-type: none"> ◦ Student accurately represents the number as groups of tens and ones in all possible ways. ◦ Student also justifies that all representations have been used. <p>*Student does not use manipulatives.</p>
7*	<p>In addition to providing evidence that the student met the expectations of level 6: Student explains how to systematically list all of the different ways to break down a two-digit number into groups of tens and ones to guarantee that all possible ways have been generated and provides an explanation as to why the system works.</p>

First Grade Mathematics

NUMBERS AND OPERATIONS IN BASE TEN (NBT)

Cluster: B. Understand place value.

Standard: 1.NBT.B.3 Compare two two-digit numbers based on the meanings of the digits in each place and use the symbols $>$, $=$, and $<$ to show the relationship.

0	Teacher presents student with 6 examples of comparison problems using two two-digit numbers, two examples where the first number is larger, two examples where the first number is smaller, and two examples where both numbers are equal.	Student does not accurately compare any examples based on the meanings of the digits in each place using the symbols greater than, less than, and equal to represent the relationship between the numbers.
1	Teacher presents student with 6 examples of comparison problems using two two-digit numbers, two where the first number is larger, two where the first number is smaller, and two where both numbers are equal.	Student accurately compares 1-3 examples based on the meanings of the digits in each place using the symbols greater than, less than, and equal to represent the relationship between the numbers.
2	Teacher presents student with 6 examples of comparison problems using two two-digit numbers, two where the first number is larger, two where the first number is smaller, and two where both numbers are equal.	Student accurately compares at 4-5 examples based on the meanings of the digits in each place using the symbols greater than, less than, and equal to represent the relationship between the numbers.
3	Teacher presents student with 6 examples of comparison problems using two two-digit numbers, two where the first number is larger, two where the first number is smaller, and two where both numbers are equal.	Student accurately compares all 6 examples based on the meanings of the digits in each place using the symbols greater than, less than, and equal to represent the relationship between the numbers.
4	In addition to providing evidence the student met the expectations for level 3: Student justifies each comparison (oral or written) by reasoning about meaning of the digits (e.g., 58 is more than 48 because 58 has 5 tens and 8 ones while 48 has 4 tens and 8 ones; or, 56 is less than 59 because they both have 5 tens but 6 ones in 56 is less than 9 ones in 59).	
5	In addition to providing evidence the student met the expectations of level 3 and 4:	
	<ul style="list-style-type: none"> • Teacher presents student with five two-digit numbers and prompts the student to place them in order from least to greatest or greatest to least. <ul style="list-style-type: none"> ◦ Student accurately orders the numbers based on the meanings of the digits in each place and uses the symbols $>$ or $<$ to show the relationships. Student provides justification for the comparison (oral or written) by explaining the reasoning used. • Teacher presents student with a different set of five two-digit numbers and uses the same prompt. <ul style="list-style-type: none"> ◦ Student accurately orders the second group of numbers based on the meanings of the digits in each place and uses the symbols $>$ or $<$ to show the relationships. Student provides justification for the comparison (oral or written) by explaining the reasoning used. 	
6*	In addition to providing evidence the student met the expectations of level 3, 4, and 5:	
	<ul style="list-style-type: none"> • Teacher presents student with two addition and/or subtraction expressions (values are less than 100). <ul style="list-style-type: none"> ◦ Student accurately compares the two expressions based on the meanings of the digits from the resulting sum or difference or the relationship that exists between the magnitude of the numbers and the operation. The student correctly uses the symbols $>$, $=$, and $<$ to show the relationship; and provides justification for the comparison (oral or written) by explaining the reasoning used (e.g., $37 + 12 > 37 + 10$ because $49 > 47$ or $37 + 12$ is greater because 12 is a greater number than 10 and both are being added to the same quantity. $33 + 24 < 45 + 39$ because $57 < 84$ or 33 is less than 45 and 24 is less than 39 so the sum of $33 + 24$ will be less than the sum of $45 + 39$). 	
7*	In addition to providing evidence that the student met the expectations of level 3, 4, 5, and 6:	
	<ul style="list-style-type: none"> • Teacher presents student with five addition and subtraction expressions (values are less than 100) and prompts the student to order them from either least to greatest or greatest to least. <ul style="list-style-type: none"> ◦ Student accurately orders all expressions based on their value, correctly uses the symbols $>$ and $<$ to show the relationship, and provides justification for the comparisons (oral or written) by explaining the reasoning used. 	

First Grade Mathematics

NUMBERS AND OPERATIONS IN BASE TEN (NBT)

Cluster: C. Use place value understanding and properties of operations to add and subtract.

Standard: 1.NBT.C.4 Add a two-digit number to a one-digit number and a two-digit number to a multiple of ten (within 100). Use concrete models, drawings, strategies based on place value, properties of operations, and/or the relationship between addition and subtraction to explain the reasoning used.

0	<p>When presented with the 2 tasks below, student does not accurately complete either task:</p> <ul style="list-style-type: none">• Teacher presents student with two problems that require adding a two-digit number to a one-digit number (within 100) where composing a ten is not required (e.g., $12+4$).<ul style="list-style-type: none">○ Student accurately represents both answers using concrete models, drawings, strategies based on place value, properties of operations, and/or the relationship between addition and subtraction.• Teacher presents student with two problems that require adding a two-digit number to a multiple of ten (within 100).<ul style="list-style-type: none">○ Student accurately represents both answers using concrete models, drawings, strategies based on place value, properties of operations, and/or the relationship between addition and subtraction. <p>*No context is provided. Equations may be in vertical or horizontal formats.</p>
1	<p>When presented with the 2 tasks below, student accurately completes one task:</p> <ul style="list-style-type: none">• Teacher presents student with two problems that require adding a two-digit number to a one-digit number (within 100) where composing a ten is not required (e.g., $12+4$).<ul style="list-style-type: none">○ Student accurately represents both answers using concrete models, drawings, strategies based on place value, properties of operations, and/or the relationship between addition and subtraction.• Teacher presents student with two problems that require adding a two-digit number to a multiple of ten (within 100).<ul style="list-style-type: none">○ Student accurately represents both answers using concrete models, drawings, strategies based on place value, properties of operations, and/or the relationship between addition and subtraction. <p>*No context is provided.
